

Abstract of the Disclosure

S. 4

The subject invention pertains to a wiring clip for securing electrical wiring to metal framing members. In a specific embodiment, the subject clip can secure the wiring a required distance from the nearest edge or face of the metal framing member to which a wall board is to be secured. The wire clip generally resembles an open frame having a wire receiving area formed in the main body, where the wire receiving area is centrally located within the main body. The wire clip is generally of U-shaped configuration, with two arms being joined to the main body. The end of the first arm is bent to form a J-hook, such that the J-hook can be hooked about a first inner edge of a metal stud. The end of the second arm comprises a clip, such that the clip can be removable, secured about the second inner edge of the metal stud. The arms, as well as the main body, are resilient, such that the arms and the main body will embrace the metal stud.
